Not illustrated. 2000-06 Excerpt: . . . in the following section, however, provide insight into ground-water residence times. The calibrated final model was not used to simulate potential effects of future pumpage on regional ground-water flow in the aquifer system. Data on future pumpage needs at the regional scale are not available, and any simulations of future pumpage at this time would be contrived. It is noteworthy, however, that only a small percentage of current pumpage is associated with the regional flow systems explicitly simulated with this model. Therefore, more water associated with such regional flow systems almost certainly could be used. The quality of the ground water associated with some parts of the aquifer system, however, may limit its use. GEOCHEMISTRY Geochemical data were collected from the Midwestern Basins and Arches aquifer system to investigate the relations among ground-water chemistry, aquifer mineralogy, and present and past patterns of regional flow. The data include a synthesis of basic data from more than 1, 300 ground-water analyses of water samples from the aquifer system, as well as detailed chemical and isotopic analyses of ground water and aquifer material along general directions of regional flow. The analyses represent two hydrologic units (table 1) within the Midwestern Basins and Arches aquifer system--aquifers within glacial deposits and the carbonate-rock aquifer--and were obtained from records in the U. S. Geological Surveys National Water Information System (NWIS) data base; files of the Indiana Department of Natural Resources, the Ohio Department of Natural Resources, and the Ohio Environmental Protection Agency:...
