Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1905 Excerpt: . . . every one at some time in life conceives the idea, more or less vaguely, that it is the tendency of all gases to rise. Now the fact is that if any gas rises, it rises because of the buoyancy of the air, which is only another way of saying that the air has weight and a greater weight than the gases which rise in it. To say that gases tend to rise is analogous to saying that wood tends to rise in water. This ought not to leave with us the impression that these things are weightless. Figure 32 shows how glycerine when slowly poured from a dropper tube into a tumbler of water falls directly to the bottom and spreads out as the bottom layer in the vessel. This is the way carbon dioxide gas behaves when it is poured into a vessel of air. Figure 33 shows how alcohol when slowly poured from a dropper tube into a tumbler of water rises directly to the top and spreads out as the top layer in the vessel. This is the way hydrogen gas behaves when it is poured upward into an inverted vessel of air. Such experiments tell us that carbon dioxide, air, and hydrogen all have weight, and they tell us something of their relative weight. When we, living as we do at the bottom of the atmosphere, wish to determine how much air weighs, we proceed exactly as we would to find the...
