An important trend in modern numerical simulations is the quick improvement of computer technology that leads to the well known paradigm (see, e. g. , [78,179]): high-performance computers make it indispensable to use numerical methods of almost linear complexity in the problem size N , to maintain an adequate scaling between the computing time and improved computer facilities as N increases. In the h -version of the finite element method (FEM), the multigrid iteration realizes an $O(N)$ solver for elliptic differential equations in a domain $\Omega \subset \mathbb{R}^d$ with $N = O(h^{-d})$, where h is the mesh parameter. In the boundary element method (BEM), the traditional panel clustering, fast multi-pole and wavelet based methods as well as the modern hierarchical matrix techniques are known to provide the data-sparse approximations to the arising fully populated stiffness matrices with almost linear cost $O(Nr \log Nr)$, where $1 \leq Nr = O(h^{-d})$ is the number of degrees of freedom associated with the boundary. The aim of this book is to introduce a wider audience to the use of a new class of efficient numerical methods of almost linear complexity for solving elliptic partial differential equations (PDEs) based on their reduction to the interface. 312 pp. Englisch.
